

The Definitive Guide to AVEVA E3D 2.1: Mastering Administration, Supports, and Design Workflows

Published: October 17, 2026 | Index ID: #319

In the rapidly evolving landscape of multi-disciplinary industrial design, **AVEVA Everything3D™ (E3D) 2.1** stands as a cornerstone technology for engineering, procurement, and construction (EPC) projects. As the successor to the legacy PDMS system, E3D 2.1 integrates advanced 3D modeling with high-performance graphics and automated drawing generation. This guide provides a deep technical exploration of the E3D ecosystem, focusing on administration, the supports module, and core functionality protocols essential for senior designers and system administrators.

The Architectural Foundation of AVEVA E3D™ 2.1

AVEVA E3D™ is built upon a sophisticated data-centric architecture that separates the graphical representation from the underlying metadata. This ensures that every component—from a simple pipe support to a complex distillation column—is treated as a discrete data object within a hierarchical database structure. Understanding this hierarchy is the first step in mastering the **AVEVA E3D™ Database Management System (DBMS)**.

Database Hierarchy and Management

At the core of the system is the **Project**, which acts as the container for all engineering data. Within a project, databases are categorized by their function. These typically include:

- **System Database:** Contains project-wide settings, user permissions, and access control lists.
- **Catalog Database:** Stores the specifications (Specs) for piping, structural profiles, and components.
- **Design Database:** Houses the actual 3D model data created by designers.
- **Dictionary Database:** Defines the User Defined Attributes (UDAs) and User Defined Element Types (UDETs)

that extend the system's standard capabilities.

Proper database management requires a thorough understanding of the **Administrator User Guide**, specifically regarding the **Project Creation Wizard**. This tool automates the instantiation of these databases, ensuring that the relationships between the System, Catalog, and Design databases are correctly mapped from the onset of the project lifecycle.

Deep Dive: AVEVA E3D™ Administration and System Configuration

System administrators are responsible for the structural integrity and operational efficiency of the E3D environment. The **Administrator Command Reference Manual** provides the syntax required for low-level database manipulation and system auditing. Administering E3D involves more than just user management; it requires the configuration of **Distributed Attributes** and **Status Definitions** to track the progress of engineering entities.

The Role of User-Defined Attributes (UDAs)

Standard attributes provided by AVEVA (such as Name, Position, and Orientation) often fall short of specific project requirements. **User Defined Attributes (UDAs)** allow administrators to append custom metadata to elements. For instance, a designer might need to track the "Paint Code" or "Vendor Lead Time" for a specific support. By defining these in the Dictionary database, these attributes become available across the model and can be extracted into

reports or drawings.

Implementing Database Views and Status Control

To manage massive datasets, E3D utilizes **Database Views**. These allow users to query and display specific subsets of data without loading the entire project, significantly improving performance. Furthermore, **Status Definitions** allow teams to implement workflow gates. Elements can transition from "Work in Progress" to "Approved" or "For Construction," with permissions restricted based on the element's current status.

Technical Analysis of the Supports Module (TM-1818)

The **Supports module** of AVEVA Everything3D™ 2.1, detailed in technical manual **TM-1818**, is one of the most critical components of the software. It is used to create, modify, and delete the various types of pipe and duct supports. Unlike traditional CAD programs where supports might be simple graphical blocks, E3D supports are intelligent assemblies that interact with both the piping model and the structural framework.

The Support Creation Workflow

The creation of a support involves several algorithmic steps within the E3D engine:

1. **Selection of Support Type:** Choosing from standardized catalogs (e.g., hangers, shoes, or anchors).
2. **Attachment Geometry:** The system calculates the intersection between the pipe (or duct) and the adjacent structural element (e.g., an I-beam or concrete slab).
3. **Parameter Configuration:** Adjusting height, offset, and material thickness based on the calculated load and thermal expansion requirements.
4. **Validation:** The system checks for clashes and ensures the support adheres to the engineering specifications defined in the Catalog database.

Comparison of Support Management Techniques

The following table illustrates the differences between manual support design and the automated E3D 2.1 Supports module approach:

Feature	Manual CAD Approach	AVEVA E3D 2.1 Supports Module
Data Integration	Disconnected graphics and spreadsheets.	Full integration with Pipe/Structure metadata.
Clash Detection	Manual visual inspection.	Automated 3D clash reporting.
Bill of Materials (BOM)	Manual counting, high error rate.	Automatic extraction from 3D model.
Parametric Updates	Requires manual redraw if pipe moves.	Supports update automatically with pipe movement.
Specification Compliance	Dependent on designer memory.	Hard-coded spec limits in the Catalog.

The DRAW User Guide: Generating Engineering Deliverables

While the 3D model is the "source of truth," engineering projects still rely heavily on 2D deliverables. The **DRAW** module is the engine that converts 3D data into orthographic, isometric, and section views. The **DRAW User Guide** outlines the procedural steps for creating highly accurate drawing sheets.

Automated Drawing Generation (ADG)

The ADG functionality in E3D 2.1 allows for the batch creation of drawings. By utilizing **Library Templates**, administrators can standardize the look and feel of drawings across the entire project. Key technical components of the DRAW module include:

- Draw List: A collection of 3D elements selected to be rendered in a specific view.
- Backing Sheets: The title blocks and border frames containing project-level UDAs (e.g., Project Number, Revision).
- Annotation Rules: Logic-based labeling that automatically pulls data (like Pipe Bore or Support Tag) and places it on the drawing sheet.

Customization via .NET and Command Reference

For organizations requiring high levels of automation, E3D 2.1 supports **.NET Customisation**. This allows developers to write C# or VB.NET code to interact with the AVEVA core API. Typical use cases include custom reporting tools, automated model validators, or complex geometry generators that go beyond standard parametric capabilities.

The **Administrator Command Reference Manual** remains a vital tool even in the age of GUI-driven interfaces. Command-line interactions (PML - Programmable Macro Language) allow for rapid data querying and bulk updates that would be cumbersome in the graphical UI. For example, a single command can update the 'Status' of thousands of pipe supports simultaneously, a task that would take hours if performed manually.

Practical Implementation: A Field Guide for Project Setup

Setting up a new project in E3D 2.1 requires a disciplined approach. Failure to configure the environment correctly at the start can lead to database corruption or data loss. The following checklist, derived from the **Common Functionality User Guide**, provides a high-level roadmap:

Phase 1: Project Initialization

- Initialize the Project via the Project Creation Wizard.
- Define the World Coordinate System (WCS) and Site origins.
- Establish the Team and User access hierarchy in the System DB.
- Configure the MDS (Multi-Discipline Supports) settings if specialized support libraries are used.

Phase 2: Catalog and Spec Development

- Import or create piping and structural specifications.
- Define User System Defined Attributes for specialized reporting.
- Validate the 3D symbols (templates) for all components.

Phase 3: Design and Drafting Integration

- Set up the DRAW module backing sheets and styles.
- Configure the Inter-Departmental Design (IDD) checks to manage clash detection between piping, structural, and electrical teams.

Troubleshooting and Operational Excellence

In a multi-user environment, technical issues are inevitable. Common challenges include database locks, claim conflicts, and attribute mismatches. The **Administrator User Guide** offers several strategies for maintaining system health.

Managing Database Claims

E3D utilizes a "Claim/Release" mechanism. If a designer is working on a pipe, they "claim" it, preventing others from modifying it. A common error occurs when a user exits the software unexpectedly without releasing their claims. Administrators must use the **Admin Command Reference** to force-release these elements to avoid workflow bottlenecks.

Case Study: Failure in Support Propagation

Scenario: A piping designer moves a large diameter line, but the associated supports do not follow, resulting in "orphan" supports.

Solution: The administrator must check the **Support-to-Pipe association** in the metadata. Often, this occurs because the 'Attachment' attribute was broken during a manual delete-and-replace operation. Re-running the **TM-1818 Supports Update Macro** restores the parametric link and relocates the supports to their correct coordinates relative to the pipe centerline.

The Future of Engineering with AVEVA E3D™

The transition from manual drafting to integrated 3D environments like AVEVA E3D 2.1 represents a fundamental shift in engineering methodology. By leveraging the **Common Functionality User Guide** and the **Administrator Command Reference**, organizations can build robust design environments that minimize human error and maximize efficiency. The data-centric nature of E3D 2.1 means that the 3D model is no longer just a visual tool; it is a comprehensive database that drives procurement, fabrication, and long-term asset management. As the industry moves toward "Digital Twins," the technical accuracy of the E3D database becomes the primary asset of the engineering firm, making the roles of the administrator and the lead designer more critical than ever before.

Ultimately, mastering E3D 2.1 requires a commitment to understanding both the graphical interface and the underlying data structures. Whether through the **Supports Manual** or **.NET Customisation**, the ability to

manipulate the system at a granular level is what distinguishes a standard user from a technical expert. By adhering to the protocols outlined in the official user documentation and technical manuals, engineering teams can ensure that their projects are delivered on time, within budget, and to the highest technical standards.
